

960 Pump Curves

960

01 FLOW / SPEED

Nominal displacement flow

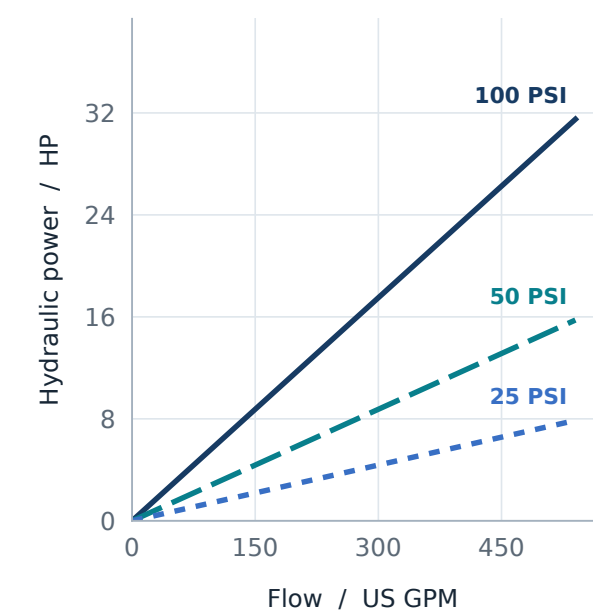

REFERENCE POINTS

Model	Curve endpoint	Flow at endpoint
960	600 RPM	540 GPM

Legacy equipment. For new equipment, see the 900 Series.

02 HYDRAULIC POWER

Differential pressure across the pump

READ THE CURVES

Flow is a reference, not guaranteed delivery. Actual output depends on viscosity, pressure, inlet conditions and internal slip.

HP = GPM × differential PSI ÷ 1,714. This is hydraulic power only; friction, viscosity, efficiency and motor service margin are excluded.

The 25 / 50 / 100 PSI lines are calculation examples, not pressure ratings or relief settings.
